

## Anode Shorted Gate Turn-Off Thyristor Types G4000EF250

### Absolute Maximum Ratings

	VOLTAGE RATINGS	MAXIMUM LIMITS	UNITS
V <sub>DRM</sub>	Repetitive peak off-state voltage, (note 1)	2500	V
V <sub>RSM</sub>	Non-repetitive peak off-state voltage, (note 1)	2500	V
V <sub>DC-link</sub>	Maximum continuous DC-link voltage	1250	V
V <sub>RRM</sub>	Repetitive peak reverse voltage	18	V
V <sub>RSM</sub>	Non-repetitive peak reverse voltage	18	V

	RATINGS	MAXIMUM LIMITS	UNITS
I <sub>TGQ</sub>	Peak turn-off current, (note 2)	4000	A
L <sub>s</sub>	Snubber loop inductance, I <sub>TM</sub> =I <sub>TGQ</sub> , (note 2)	200	nH
I <sub>T(AV)M</sub>	Mean on-state current, T <sub>sink</sub> =55°C (note 3)	1835	A
I <sub>T(RMS)</sub>	Nominal RMS on-state current, 25°C (note 3)	3815	A
I <sub>TSM</sub>	Peak non-repetitive surge current t <sub>p</sub> =10ms, (Note 4)	33	kA
I <sub>TSM2</sub>	Peak non-repetitive surge current t <sub>p</sub> =2ms, (Note 4)	41	kA
I <sup>2</sup> t	I <sup>2</sup> t capacity for fusing t <sub>p</sub> =10ms	5.45×10 <sup>6</sup>	A <sup>2</sup> s
di/dt <sub>cr</sub>	Critical rate of rise of on-state current, (note 5)	500	A/μs
P <sub>FGM</sub>	Peak forward gate power	200	W
P <sub>RGM</sub>	Peak reverse gate power	25	kW
I <sub>FGM</sub>	Peak forward gate current	100	A
V <sub>RGM</sub>	Peak reverse gate voltage (note 6).	18	V
T <sub>j op</sub>	Operating temperature range	-40 to +125	°C
T <sub>stg</sub>	Storage temperature range	-40 to +125	°C

Notes:-

- 1) V<sub>GK</sub>=-2Volts.
- 2) T<sub>j</sub>=125°C, V<sub>D</sub>=1250V, V<sub>DM</sub>≤2500V di<sub>GQ</sub>/dt=40A/μs, I<sub>TGQ</sub>=4000A and C<sub>S</sub>=6μF.
- 3) Double-side cooled, single phase; 50Hz, 180° half-sinewave.
- 4) T<sub>j(initial)</sub>=125°C, single phase, 180° sinewave, re-applied voltage V<sub>D</sub>=V<sub>R</sub>≤10V.
- 5) I<sub>T</sub>=4000A repetitive, I<sub>GM</sub>=50A, di<sub>GM</sub>/dt=50A/μs. For di/dt>500A/μs please consult the factory.
- 6) May exceed this value during turn-off avalanche period.

## Characteristics

	Parameter	MIN	TYP	MAX	TEST CONDITIONS	UNITS
$V_{TM}$	Maximum peak on-state voltage	-	3.1	3.4	$I_G=8A, I_T=4000A$	V
$I_L$	Latching current	-	40	100	$T_j=25^\circ C$	A
$I_H$	Holding current.	-	40	100	$T_j=25^\circ C$	A
$dv/dt_{cr}$	Critical rate of rise of off-state voltage	1000	-	-	$V_D=3000V, V_{GR}=-2V$	V/ $\mu s$
$I_{DRM}$	Peak off state current	-	-	100	Rated $V_{DRM}, V_{GR}=-2V$	mA
$I_{RRM}$	Peak reverse current	-	-	10	$V_{RR}=18V$	mA
$I_{GKM}$	Peak negative gate leakage current	-	-	1	$V_{GR}=-18V$	mA
$V_{GT}$	Gate trigger voltage	-	1.0	-	$T_j=-40^\circ C$	V
		-	0.8	5	$T_j=25^\circ C \quad V_D=25V, R_L=25m\Omega$	V
		-	0.7	-	$T_j=125^\circ C$	V
$I_{GT}$	Gate trigger current	-	2.6	10	$T_j=-40^\circ C$	A
		-	1.5	5	$T_j=25^\circ C \quad V_D=25V, R_L=25m\Omega$	A
		0.05	0.65	1.75	$T_j=125^\circ C$	A
$t_d$	Delay time	-	1.3	2	$V_D=1250V, I_{TGO}=4000A, di_T/dt=400A/\mu s, I_{GM}=50A, di_G/dt=20A/\mu s, C_S=6\mu F, R_S=5\Omega$	$\mu s$
$t_{gt}$	Turn-on time	-	4.25	7		$\mu s$
$E_{on}$	Turn-on energy	-	0.65	2.0		J
$t_f$	Fall time	-	1.8	-	$V_D=1250V, V_{DM}=80\% V_{DRM}, I_{TGO}=4000A, di_{GQ}/dt=50A/\mu s, V_{GR}=-17V, C_S=6\mu F$	$\mu s$
$t_s$	Storage time	-	24	30		$\mu s$
$t_{gq}$	Turn-off time	-	25	35		$\mu s$
$I_{GQM}$	Peak turn-off gate current	-	1000	-		A
$Q_{GQ}$	Turn-off gate charge	-	14.5	-		mC
$t_{tail}$	Tail time	-	6.5	-		$\mu s$
$E_{off}$	Turn-off energy	-	4.8	5.8		J
$R_{thJK}$	Thermal resistance junction to sink	-	-	0.011	Double side cooled	K/kW
		-	-	0.020	Cathode side cooled	K/kW
		-	-	0.024	Anode side cooled	K/kW
F	Mounting force	36	-	48	(see note 2)	kN
$W_t$	Weight	-	1.5	-		kg

Notes:-

- 1) Unless otherwise indicated  $T_j=125^\circ C$ .
- 2) For other clamping forces, consult factory.

## Notes on ratings and characteristics.

### 1. Maximum Ratings.

#### 1.1 Off-state voltage ratings.

Unless otherwise indicated, all off-state voltage ratings are given for gate conditions as diagram 1. It should be noted that  $V_{DRM}$  is the repeatable peak voltage, which may be applied to the device and does not relate to a DC operating condition.

Diagram 1.

#### 1.2 Peak turn-off current.

The figure given in maximum ratings is the highest value for normal operation of the device under conditions given in note 2 of ratings. A snubber circuit equivalent to that given in diagram 2 is assumed. If a more complex snubber, such as an Underland circuit, is employed then the equivalent  $C_S$  should be used and  $L_S < 0.2\mu H$  must be ensured.

Diagram 2.

#### 1.3 R.M.S and average current.

Measured as for standard thyristor conditions, double side cooled, single phase, 50Hz,  $180^\circ$  half-sinewave. These are included as a guide to compare the alternative types of GTO thyristors available; values cannot be applied to practical applications, as they do not include switching losses.

#### 1.4 Surge rating and $I^2t$ .

Ratings are for half-sinewave, peak value against duration is given in the curve of figure 2.

#### 1.5 Snubber loop inductance.

Use of GTO thyristors with snubber loop inductance,  $L_S < 0.2\mu H$  implies no dangerous  $V_S$  voltages (see diagrams 2 & 3) can be applied, provided the other conditions given in note 1.2 are enforced. Alternatively  $V_S$  should be limited to 800 Volts to avoid possible device failure.

Diagram 3.

#### 1.6 Gate ratings

The absolute conditions above which the gate may be damaged. It is permitted to allow  $V_{GK(AV)}$  during turn-off to exceed  $V_{RGM}$  which is the implied DC condition.

## 2 Characteristics

### 2.1 Instantaneous on-state voltage

Measured using a 500µs square pulse, see also the curves of figure 1 for other values of  $I_{TM}$ .

### 2.2 Latching and holding current

These are considered to be approximately equal and only the latching current is measured, type test only as outlined below. The test circuit and wave diagrams are given in diagram 4. The anode current is monitored on an oscilloscope while  $V_D$  is increased, until the current is seen to flow during the un-gated period between the end of  $I_G$  and the application of reverse gate voltage. Test frequency is 100Hz with  $I_{GM}$  &  $I_G$  as for  $t_d$  of characteristic data.

Diagram 4, Latching test circuit and waveforms.

### 2.3 Critical dv/dt

The gate conditions are the same as for 1.1, this characteristic is for off-state only and does not relate to dv/dt at turn-off. The measurement, type test only, is conducted using the exponential ramp method as shown in diagram 5. It should be noted that GTO thyristors have a poor static dv/dt capability if the gate is open circuit or  $R_{GK}$  is high impedance. Typical values: - dv/dt < 100V/µs for  $R_{GK} > 10\Omega$ .

Diagram 5, Definition of dv/dt.

### 2.4 Off-state leakage.

For  $I_{DRM}$  see notes 1.1. For gate leakage  $I_{GK}$ , the off-state gate circuit is required to sink this leakage and still maintain minimum of - 2 Volts. See diagram 6.

Diagram 6.

### 2.5 Gate trigger characteristics.

These are measured by slowly ramping up the gate current and monitoring the transition of anode current and voltage (see diagram 7). Maximum and typical data of gate trigger current, for the full junction temperature range, is given in the curves of figure 6. Only typical figures are given for gate trigger voltage for the full allowable junction temperature range. Figure 6 should be used when considering forward gate drive circuit requirement. The gate drive requirements should always be calculated for lowest junction temperature start-up condition.

Diagram 7, Gate trigger circuit and waveforms.

2.6 Turn-on characteristics

The definitions of turn-on parameters used in the characteristic data are given in diagram 8.

Diagram 8, Turn-on wave-diagrams.

2.7 Turn-off characteristics

The definitions of turn-off parameters used in the characteristic data are given in diagram 9.

Diagram 9, Turn-off parameter definitions.
