35 A Alternistor (High Commutation) TRIACs

RoHS

Description:

The 35 A bi-directional solid state switch series is designed for AC switching and phase control applications such as motor speed and temperature modulation controls, lighting controls, and static switching relays.

Standard type components normally operate in Quadrants I & III triggered from AC line.

Standard alternistor TRIAC components operate with in-phase signals in Quadrants I or III and only unipolar negative gate pulses for Quadrant II or III. The alternistor TRIAC will not operate in Quadrant IV. These are used in circuit applications requiring a high dv/dt capability.

Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
